

EDUCATION	China Academy of Launch Vehicle Technology Beijing, China <i>M.S. Student in Artificial Intelligence</i> 2024 – Present - Jointly supervised by Prof. Weixin Zeng and Prof. Xiang Zhao at the National Key Laboratory of Big Data and Decision, National University of Defense Technology, China - Research interests: Foundation Model Training, Data and Representation, Self-Improving AI Systems, LLM Agents, AI4AI, AI for Science Xi'an Jiaotong University Xi'an, China <i>B.Eng. in Electrical Engineering and Automation</i> 2019 – 2023
RESEARCH EXPERIENCE	Shanghai Artificial Intelligence Laboratory Shanghai, China <i>Incoming Research Intern AI4AI / AI for Science</i> Advised by Yeyun Chen and Yuqiang Li; exploring AI4AI with AI4Science tasks.
PUBLICATIONS	<i>* denotes equal contribution.</i> C1 Feng Liang, Weixin Zeng, Runhao Zhao, Xiang Zhao. NeSTR: A Neuro-Symbolic Abductive Framework for Temporal Reasoning in Large Language Models. <i>Proceedings of the AAAI Conference on Artificial Intelligence (AAAI '2026 CCF-A)</i>. P1 Feng Liang, Weixin Zeng, Runhao Zhao, Mingjun Zhou, Shaoshi Yang, Xiang Zhao. ChronoSynth: Constraint-Aware Question Synthesis over Temporal Knowledge Graphs. <i>Manuscript under review</i>. P2 Felicia Jiang*, Runhao Zhao*, Feng Liang*, Taoyong Cui, Yinghan Zhang, et al., Wentao Zhang, Pheng Ann Heng, Yu Li, Xin Wang. 3DisoDeepPF: Structure-Aware Multimodal Protein Function Prediction. <i>bioRxiv preprint, submitted to Nature Biotechnology (Impact Factor = 43.77)</i>.
SELECTED RESEARCH	NeSTR: Self-Improving Neuro-Symbolic Reasoning for LLM Mar. 2025 – Aug. 2025 <i>First Author LLM Agents / Temporal Reasoning / Neuro-Symbolic Reasoning</i> Built a zero-shot neuro-symbolic LLM agent that decomposes temporal QA into temporal parsing, symbolic state construction, abductive reasoning, constraint checking, and iterative self-correction; achieved 89.7 average F1 across temporal QA benchmarks. ChronoSynth: Memory-Augmented Data Synthesis Harness Sep. 2025 – Jun. 2026 <i>First Author LLM Agents / Data Synthesis / Temporal Knowledge Graphs</i> Developed a memory-augmented, feedback-driven data synthesis harness for constraint-preserving graph-to-question synthesis, using memory-guided generation and iterative semantic repair to reduce temporal errors and improve BLEU-4 by up to 53.3% on MultiTQ. 3DisoDeepPF: Structure-Aware Protein Function Prediction Sep. 2025 – May 2026 <i>Co-first Author AI for Science / Protein Language Model Collaboration with CUHK</i> Co-developed a multimodal protein isoform function prediction framework integrating protein language model, structural, domain, and graph-neighborhood signals. One-Step Structure Generation for Efficient Nanobody Design Mar. 2026 – Present <i>Co-first Author AI for Science / Generative Model / Antibody Design Collaboration with CUHK</i> Exploring one-step antigen-conditioned nanobody structure generation to reduce inference

cost while maintaining structural plausibility and candidate diversity.

AWARDS AND HONORS	Global Top 20 / 700+ Teams , KDD Cup 2026: Data Agents for Complex Data Analysis	
	2026	
	Bronze Medal , CAFA 6 Protein Function Prediction Challenge (Kaggle)	2026
	Outstanding Award , National College Student Innovation Training Program	2021

RESEARCH DIRECTIONS	Data, Representation, and Scalable Learning. Motivated by scaling laws and the success of large-scale pre-training, I am interested in whether increasingly difficult scientific and engineering tasks can be made learnable by jointly designing data, representation, and training. I view natural language, code, symbolic, and formal languages as interfaces that expose task structure to foundation models, allowing scalable learning to compress reusable patterns into generalizable capabilities. • Data and Task Representation: constructing and selecting high-quality training data, and representing complex tasks through natural language, code, symbols, and formal languages to make their underlying structure learnable by foundation models. • Scalable Foundation Model Training: pre-training, scaling laws, data distribution and curriculum, post-training, continual learning, and feedback-driven adaptation for sustained capability growth. • Self-Evolving AI and AI4AI: closing the loop between models, agents, and environments so that interaction and experimentation generate new data, memory, skills, and model updates, with scientific and engineering problems as challenging real-world testbeds.
